Anodized Coating Maintenance

Cleaning of Anodized Aluminum

This is a brief summary of the best way to clean your anodized aluminum. Always refer to your cleaning product's MSDS sheet before using. When cleaning anodized aluminum, you want to use a sponge and gentle soap (mild dish soap). You must rinse well. Do not use harsh acidic or alkaline cleaners because they may destroy the finish. Use solvents with care as they may stain the finish. Regardless of the technique, be sure to try a test area first. Always try a test small area first to prevent a widespread problem. Always rinse thoroughly.

Clean anodized aluminum with mild soap and water using a soft towel or sponge is recommended.

- Rinse thoroughly and completely with direct fresh water. The important point is to clean and rinse your anodized aluminum well!
- When using metal protection products be sure they are formulated for anodized aluminum.

Most MSDS sheets of any commercial cleaning products have a phone number to reach technical information support, and it is suggested to contact the manufacturer listed for technical questions on the product to ensure that the product is safe for anodized aluminum.
